

Claims:

A listing of the claims has been included for reference. Claims 12-18 were previously cancelled.

Listing of Claims:

1. (Previously Presented) A method, comprising:
establishing a connection between a wireless electronic device and one or more supervisory devices associated with a local area of wireless coverage;
the wireless electronic device sending device preference and capability information to at least one of the one or more supervisory devices;
at least one of the one or more supervisory devices sending local area preference and restriction information to the wireless electronic device; and
determining which functions are available for use on the wireless device in the local area using the device preference and capability information and the local area preference and restriction information.

2. (Original) The method of claim 1 wherein the environment protocol further includes one or more priority levels associated with the local coverage area and a priority level associated with each function of the wireless device.

3. (Previously Presented) The method of claim 2, further comprising:

comparing the one or more priority levels associated with the local area supervisory devices to each wireless device function priority level; and
setting permissions for the operation of each wireless device function based on the results of the comparison.

4. (Original) The method of claim 3 wherein setting permissions for the operation of each wireless device function further comprises:

allowing the operation of functions that have a higher priority level than any local area supervisory device priority level; and

disallowing the operation of functions that have a lower priority level than a local area supervisory device priority level.

5. (Original) The method of claim 4 wherein determining which functions are available on the wireless device further comprises configuring the wireless device to operate with the settings most preferred by the user that are still allowed by the one or more local area supervisory devices.

6. (Original) The method of claim 1 wherein the environment protocol is comprised of a set of preferences associated with the functions of the wireless device and a set of preferences and restrictions associated with the one or more local area supervisory devices.

7. (Previously Presented) The method of claim 6, wherein negotiating an associated environment protocol between the wireless device and the local area supervisory devices further comprising:

comparing the priority level associated with each local area supervisory device preference and restriction to the priority level associated with each wireless device function; and

setting permissions for the operation of each wireless device function based on the results of the comparison.

8. (Previously Presented) The method of claim 1, further comprising:

comparing the local area preferences and restrictions associated with each local area supervisory device with the capabilities and preferences of the wireless device; and

setting permissions for the operation of each wireless device function based on the results of the comparison.

9. (Original) The method of claim 1 wherein the determination of which functions are available to the wireless device is made by the wireless device.

10. (Original) The method of claim 1 wherein the determination of which functions are available to the wireless device is made by one or more of the local area supervisory devices.

11. (Original) The method of claim 1 wherein the determination of which functions are available to the wireless device is made by a combination of the wireless device and one or more local area supervisory devices.

12-18. (Cancelled)

19. (Previously Presented) A system, comprising:
one or more supervisory devices associated with one or more local areas of wireless coverage;
a wireless electronic device, wherein the wireless electronic device comprises logic to:
 establish a connection between the wireless electronic device and at least one of the one or more supervisory devices;
 send device preference and capability information to at least one of the one or more supervisory devices;
 receiving local area preference and restriction information from at least one of the one or more supervisory devices; and
 determine which functions are available for use on the wireless device in the local area using the device preference and capability information and the local area preference and restriction information.

20. (Original) The system of claim 19 wherein the environment protocol further includes one or more priority levels associated with the local coverage area and a priority level associated with each function of the wireless device.

21. (Previously Presented) The system of claim 20, further comprising:
comparing the one or more priority levels associated with the local area
supervisory devices to each wireless device function priority level; and
setting permissions for the operation of each wireless device function based on the
results of the comparison.

22. (Original) The system of claim 21 wherein setting permissions for the
operation of each wireless device function further comprises:
allowing the operation of functions that have a higher priority level than any local
area supervisory device priority level; and
disallowing the operation of functions that have a lower priority level than a local
area supervisory device priority level.

23. (Original) The system of claim 22 wherein determining which
functions are available on the wireless device further comprises configuring the wireless
device to operate with the settings most preferred by the user that are still allowed by the
one or more local area supervisory devices.

24. (Original) The system of claim 19 wherein the environment protocol is comprised of a set of preferences associated with the functions of the wireless device and a set of preferences and restrictions associated with the one or more local area supervisory devices.

25. (Previously Presented) The system of claim 24, further comprising:
comparing the priority level associated with each local area supervisory device preference and restriction to the priority level associated with each wireless device function; and
setting permissions for the operation of each wireless device function based on the results of the comparison.

26. (Previously Presented) The system of claim 19, further comprising:
comparing the local area preferences and restrictions associated with each local area supervisory device with the capabilities and preferences of the wireless device; and
setting permissions for the operation of each wireless device function based on the results of the comparison.

27. (Original) The system of claim 19 wherein the determination of which functions are available to the wireless device is made by the wireless device.

28. (Original) The system of claim 19 wherein the determination of which functions are available to the wireless device is made by one or more of the local area supervisory devices.

29. (Original) The system of claim 19 wherein the determination of which functions are available to the wireless device is made by a combination of the wireless device and one or more local area supervisory devices.
